

## Requirements

Please ensure your web host meets the application requirements. The list of requirements can be found [here](#).

## Uploading Files

Unzip the Interspire Website Publisher package onto your local hard drive. If you don't have Winzip, you can download it for free [here](#). Using an FTP program (such as Filezilla, which is free, or a commercial package such as CuteFTP), login to your web server and copy the Interspire Website Publisher files across into your base website directory. This directory is commonly called 'public\_html', 'html', 'www' or 'website\_html'. If you're not sure what it is, your webhost provider will be able to tell you.

## File Permissions

Interspire Website Publisher requires the following files/directories to have 'write' permissions set. If you're running on a Linux or Unix web host, you can use your FTP program and use the 'CHMOD' ('Change Mode') function to grant write permissions. If your host is running Windows, you will need to contact them about setting up write permissions on these files/folders. Also, if a folder listed here doesn't exist, please create it.

**Folders, CHMOD these to 757:**

- /cache/
- /configs/
- /files/
- /images/
- /modules/
- /tmp/
- /tmp/tplthumbs/
- /templates/

*Note: Although it says 757, some webhosts may require 775 or 777 instead.*

## MySQL Database

Interspire Website Publisher makes use of a MySQL database to store your data. This database must be created before you run the Interspire Website Publisher installation wizard. Your MySQL user account should also have full grant access to that database.

You will need the database connection details during the setup wizard.

Setting up your database may differ with your webhost and what software they use for your web hosting control panel:

- If your webhost is running 'cPanel', read this [guide](#)
- If your webhost is running 'Plesk', read this [guide](#).

- If your webhost uses a different website control panel, read this [guide](#).

## Setup Wizard

Interspire Website Publisher includes a simple one step installation process.

To start the setup wizard, navigate to the directory that you uploaded Interspire Website Publisher to, for example: <http://www.example.com/websitepublisher/>. The Interspire Website Publisher setup wizard will appear. It contains the following fields:

- License Key - Copy the license key you received when you purchased ArticleLive and paste it here.
- Website Name - This is the title of your website. It can be changed later via your settings page.
- Website Path- This is the URL to your Interspire Website Publisher installation (not your main website if this is in a sub folder)
- Email Address - This is the email that will be used for the super admin user that will be created, also it will be the default contact email which can be changed later via your settings page.
- Password & Confirm Password - This will become the password for your admin user. The username will be 'admin'.
- Database Information - You will need your database username, password, database name and host (usually 'localhost', though this may vary with some hosts).
- Send Server Configuration - This will send information about your server back to us. The data sent will be basic information such as your PHP version, MySQL version, etc. No information that can identify you or your website will be sent, it is completely anonymous. This will aid us in future development to know what versions of PHP and MySQL we can support among other things.

Your Interspire Website Publisher configuration details will now be saved into the configs/config.php file. Your MySQL database tables will also been created.

Congratulations, you are now ready to login to the Interspire Website Publisher control panel and start adding content! Your control panel will be accessible by adding '/admin' onto the end of your website URL.
